The first of its kind. The last one you'll ever need. HORL launches resharpenable scissors.

Freiburg, 2025 - it's time to redefine the standards for scissors - Freiburg-based manufacturer HORL launches the first household scissors that can be easily resharpened with the Rolling Knife Sharpener. Known for its expertise in product development, HORL is venturing into a completely new product category after years of research in the field of scissors. With maximum cutting performance across every millimeter of the blade, the scissors can handle more than 100 different materials. Inside, high-precision technology ensures that the scissors can be easily dismantled and resharpened - again and again.

It's the first of its kind and the last you'll need - this is HORL's promise in response to the frequently asked question about a solution for sharpening household scissors. "We started development with the vision of creating a product for generations. A product that rethinks an entire category. Our scissors aim always to be sharp and offer unprecedented durability," says engineer and founder Otmar Horl.

The scissors' special feature is the combination of high-precision technology and simultaneous simplicity. Every line, edge, and shape has an ergonomic, technical function while ensuring an elegant design. Forged from high-quality kitchen knife steel and equipped with the HORL cross-hatch grind, the scissors achieve a level of sharpness that was previously only possible with high-quality kitchen knives.

"We have accepted the state of blunt household scissors for far too long. This is our idea, to simply resharpen scissors ourselves and without any prior knowledge. We want to offer a completely new cutting experience that will delight our customers every time they use them," says Julian Ruf, Manufacturing and R&D Director at HORL. As usual, HORL relies on maximum quality in terms of production and cooperation with regional manufacturing partners at the foot of the Black Forest.

How-to

A detailed application and further information on the HORL Scissors and the launch of the new HORL3 Rolling Knife Sharpeners can be found in the keynote video of the pre-launch event. Information on the scissors from minute 35:36 www.youtube.com/watch?v=_6uXyd0U9Rc

One movement, two blades.

Take the scissors in both hands and open them. An audible click signals that the resistance has been overcome and the two halves can be separated.

A quick-loaded spring-release specially developed by HORL and a bayonet clamp ensure dynamic pre-tensioning. As a result, the scissors cut precisely and straight from the first to the last millimeter along the entire cutting edge.

Attach, sharpen, cut.

Each half of the scissors has three coordinated contact surfaces. These hold the scissors at a 45° angle without tools, which ensures a robust yet delicate result. Just a few strokes with the HORL ceramic grinding disc are enough to restore the scissors to their original sharpness.

After grinding the first half of the scissors, the two halves are reassembled. The burr is removed by snipping the scissors three to five times in the air. The entire process is then repeated with the other half of the scissors.

The HORL Scissors are compatible with the HORL2, HORL2 Pro, HORL3 and HORL3 Pro Rolling Knife Sharpener models. Available at horl.com/horl-scissors and at the POS at specialist retail partners. RRP: 349 USD.
