

Swagger

The bipod with moves!

November 12, 2015

For Immediate Release

Introducing Swagger, the new bipod that gives you unmatched shooting agility

Ordinary bipods, monopods or shooting sticks function as a barrel rest to reduce shooter fatigue and add stability to enhance accuracy. They have not fundamentally changed in over 100 years. Until now!

Introducing Swagger, a new bipod that gives you far more shooting agility and the ability to shoot while prone, sitting or standing. Swagger replaces bipods or shooting sticks that must be held to stabilize, must be carried, are heavy, noisy and limiting in how they allow you to shoot.

Swagger mounts easily to your gun stock in seconds, adjusts for hunter size and its legs retract into the chassis for easy and quiet transportation as well as protection. And, Swagger has no metal hinges to dig into your shoulder as you carry your firearm. There are two Swagger models, a field model and a treestand/blind model.

Shoot with confidence. Shoot with Swagger!
