

National Primate Research Centers

Improving Health, Advancing Science

The National Primate Research Centers serve as a national scientific resource for research that advances human health through the use of nonhuman primates (NHPs). The centers provide animals, expertise and specialized facilities and equipment to scientists. Our new website is designed to help investigators determine which NPRCs provide appropriate expertise and resources to help the investigators conduct their studies, and to identify collaborative scientists at the NPRCs who can provide advice on the appropriate use of NHP models and assays.

For contact information, please visit: NPRCresearch.org
